

# **FASTbook Online (Optional Web Calendar)**

## **Server Requirements**

*What do I need to run FASTbook Online?*

### For the ASP Version:

Any Windows 98/NT/2000/XP/2003 machine with a web server capable of displaying ASP pages. FBOOnline (ASP) uses Microsoft's Active Server Pages technology and must be used on a web server that supports this. Usually, this IIS (Internet Information Server). An ODBC driver for the database will also need to be installed and is provided with the product.

It is currently known to work on the following web servers.

- Microsoft Internet Information Server 4.0, 5.0, 5.1, 6.0
- Microsoft Personal Web Server 5.0
- WebSite Pro

### For the JSP Version:

Any Windows 98/NT/2000/XP/2003 machine with a web server and the java run-time environment. FBOOnline (JSP) uses Java Server Pages (JSP) and must be used on a web server that supports that technology. It is currently known to work on the following web servers. A JDBC driver class to connect to the database will be used and will be provided with the product.

- Apache / Tomcat
- Microsoft Internet Information Server 4.0, 5.0, 5.1, 6.0

And many others that support Java's JSP and Servlets

### For Both Versions:

We do recommend that you increase the memory to the recommended amount for that machine as opposed to just the bare minimum required. Also, a good processor can help keep the computer's workload to a minimum. A Pentium II 266 mHz or better is recommended. The computer must also be networked to allow other machines to view.
